#### WARRANTY

Avtech Electrosystems Ltd. warrants products of its manufacture to be free from defects in material and workmanship under conditions of normal use. If, within one year after delivery to the original owner, and after prepaid return by the original owner, this Avtech product is found to be defective, Avtech shall at its option repair or replace said defective item. This warranty does not apply to units which have been dissembled, modified or subjected to conditions exceeding the applicable specifications or ratings. This warranty is the extent of the obligation assumed by Avtech with respect to this product and no other warranty or guarantee is either expressed or implied.

#### INTRODUCTION

The AVL-5-B-PN-TR-DP-KMPD is a customized ultra-high-speed pulse generator with IEEE-488.2 GPIB and RS-232 ports for computer control.

Each trigger event triggers a pulse doublet (instead of a single pulse). The first and second pulses in the doublet have independently variable amplitude (adjustable from 50V to 400V) and pulse width (adjustable from 8 ns to 100 ns). Both must have the same polarity, however. The delay of the first pulse is adjustable over a range of 0 to 1.0 seconds, relative to the SYNC output. (When externally triggered, the SYNC output will have a fixed propagation delay of approximately 350 ns relative to the trigger input.) The second pulse is delayed relative to the first by an adjustable setting of 200 ns to 1.0 seconds (not to exceed 50% of the period). The separation resolution varies, but it is always better than 0.15% of (programmed separation + 20 ns).

A 50 Ohm load is *required* for proper operation. The output stage may be damaged if the output is not terminated into a  $50\Omega$  load.

The AVL-5-B-PN-TR-DP-KMPD is a highly flexible instrument. Aside from the internal trigger source, it can also be triggered or gated by external TTL-level signals. A front-panel pushbutton or a computer command can also be used to trigger the instrument.

The AVL-5-B-PN-TR-DP-KMPD features front panel keyboard and adjust knob control of the output pulse parameters along with a four line by 40-character backlit LCD display of the output amplitude, pulse width, pulse repetition frequency, and delay. The instrument includes memory to store up to four complete instrument setups. The operator may use the front panel or the computer interface to store a complete "snapshot" of all key instrument settings, and recall this setup at a later time.

This instrument is intended for use in research, development, test and calibration laboratories by qualified personnel.

# **SPECIFICATIONS**

pulses in the doublet have independently variable amplitude (adjustable from 50V to 400\) and pulse width (adjustable from 8 ns to 100 ns). Both must have the same polarity, however. The delay of the first pulse is adjustable over a range of 0 to 1.0 seconds, relative to the SYNC output. (When externally triggered, the SYNC output will have a fixed propagation delay of approximately 350 ns relative to the trigger input.) The second pulse delayed relative to the first by an adjustable setting of 200 ns to 1.0 seconds (not to exceed 50% of the period). The separation resolution varies, but it is always better than 0.15% of (programmed separation + 20 ns).  Polarity:  Positive or negative, switchable  Propagation delay:  Propagation delay:  350 ns (Ext trig in to pulse out)  Jitter:  \$\frac{\pmathrm{\text{ti0}}{\pmathrm{\text{tig}}} \text{ in to pulse out)}  Standard on -B units.  Check \$\frac{\text{http://www.avtechpulse.com/labview}}{\text{for availability and downloads}}  Settings resolution:  The resolution of the timing parameters varies, but is always better than 0.15% of the se value. The amplitude resolution is typically 0.02% of the maximum amplitude.  Settings accuracy:  Trigger required:  Settings accuracy:  Trigger required:  Setternal trigger mode: + 5 Volts, 50 to 500 ns (TTL)  Sync delay':  Variable 0 to ±1 second, sync out to pulse out  Sync output:  + 3 Volt, 100 ns, will drive 50 Ohm loads  Gate input:  Synchronous. Active high or low, switchable. Suppresses triggering when active.  Connectors:  BNC  Power requirements:  100 - 240 Volts, 50 - 60 Hz  Dimensions:  H x W x D: 100 mm x 430 mm x 375 mm (3.9" x 17" x 14.8")  Chassis material:  Cast aluminum frame & handles, blue vinyl on aluminum cover plates  Mounting:		
SOV to 400V, adjustable	Model:	AVL-5-B
Fall time (80%-20%): ≤ 5 ns  Pulse width (FWHM): 8 - 100 ns  Doublet repetition rate: 0 to 2 kHz  Doublet waveform: Each trigger event triggers a pulse doublet (instead of a single pulse). The first and secor pulses in the doublet have independently variable amplitude (adjustable from 50V to 400) and pulse width (adjustable from 8 ns to 100 ns). Both must have the same polarity, however. The delay of the first pulse is adjustable over a range of 0 to 1.0 seconds, relative to the SYNC output. (When externally triggered, the SYNC output will have a fixed propagation delay of approximately 350 ns relative to the trigger input.) The second pulse delayed relative to the first by an adjustable setting of 200 ns to 1.0 seconds (not to exceed 50% of the period). The separation resolution varies, but it is always better than 0.15% of (programmed separation + 20 ns).  Polarity: Positive or negative, switchable  Propagation delay: −350 ns (Ext trig in to pulse out)  Jitter: ± 100 ps ± 0.03% of sync delay (Ext trig in to pulse out)  GPIB & RS-232 control:  LabView drivers: Check <a href="http://www.avtechpulse.com/labview">http://www.avtechpulse.com/labview</a> for availability and downloads  Settings resolution: The resolution of the timing parameters varies, but it is always better than 0.15% of the se value. The amplitude resolution is typically 0.02% of the maximum amplitude.  Settings accuracy: Typically ± 4% (± 2 ns or ± 4% of max. amplitude) after 10 minute warmup. For high-accuracy applications requiring traceable calibration, verify the output parameters with a calibrated oscilloscope.  Trigger required: External trigger mode: + 5 Volts, 50 to 500 ns (TTL)  Sync delay¹: Variable 0 to ±1 second, sync out to pulse out  Sync output: +3 Volt, 100 ns, will drive 50 Ohm loads  Gate input: Synchronous. Active high or low, switchable. Suppresses triggering when active.  Connectors: BNC  Power requirements: 100 - 240 Volts, 50 - 60 Hz  Dimensions: H × W × D: 100 mm × 430 mm × 375 mm (3.9° × 17° × 14.8°)  Chassis material:		50V to 400V, adjustable
Pulse width (FWHM):   Doublet repetition rate:   Doublet waveform:   Each trigger event triggers a pulse doublet (instead of a single pulse). The first and secor pulses in the doublet have independently variable amplitude (adjustable from 50V to 400V and pulse width (adjustable from 8 ns to 100 ns). Both must have the same polarity, however. The delay of the first pulse is adjustable over a range of 0 to 1.0 seconds, relative to the SYNC output. (When externally triggered, the SYNC Output vill have a fixed propagation delay of approximately 350 ns relative to the trigger input.) The second pulse delayed relative to the first by an adjustable setting of 200 ns to 1.0 seconds (not to excee 50% of the period). Temperature range: +5°C to +40°C	Mounting:	Any
<u> </u>	Temperature range:	+5°C to +40°C

Delay must be less than the period (1 / PRF).
 A 50 Ohm load is required. Other loads may damage the instrument. Consult Avtech (info@avtechpulse.com) if you need to drive other load impedances.

#### **REGULATORY NOTES**

#### FCC PART 18

This device complies with part 18 of the FCC rules for non-consumer industrial, scientific and medical (ISM) equipment.

This instrument is enclosed in a rugged metal chassis and uses a filtered power entry module (where applicable). The main output signal is provided on a shielded connector that is intended to be used with shielded coaxial cabling and a shielded load. Under these conditions, the interference potential of this instrument is low.

If interference is observed, check that appropriate well-shielded cabling is used on the output connectors. Contact Avtech (info@avtechpulse.com) for advice if you are unsure of the most appropriate cabling. Also, check that your load is adequately shielded. It may be necessary to enclose the load in a metal enclosure.

If any of the connectors on the instrument are unused, they should be covered with shielded metal "dust caps" to reduce the interference potential.

This instrument does not normally require regular maintenance to minimize interference potential. However, if loose hardware or connectors are noted, they should be tightened. Contact Avtech (info@avtechpulse.com) if you require assistance.

#### **EC DECLARATION OF CONFORMITY**

We

Avtech Electrosystems Ltd. P.O. Box 5120, LCD Merivale Ottawa, Ontario Canada K2C 3H5

declare that this pulse generator meets the intent of Directive 2004/108/EG for Electromagnetic Compatibility. Compliance pertains to the following specifications as listed in the official Journal of the European Communities:

EN 50081-1 Emission

EN 50082-1 Immunity

and that this pulse generator meets the intent of the Low Voltage Directive 72/23/EEC as amended by 93/68/EEC. Compliance pertains to the following specifications as listed in the official Journal of the European Communities:

EN 61010-1:2001 Safety requirements for electrical equipment for measurement, control, and laboratory use

#### DIRECTIVE 2002/95/EC (RoHS)

This instrument is exempt from Directive 2002/95/EC of the European Parliament and of the Council of 27 January 2003 on the Restriction of the use of certain Hazardous Substances (RoHS) in electrical and electronic equipment. Specifically, Avtech instruments are considered "Monitoring and control instruments" (Category 9) as defined in Annex 1A of Directive 2002/96/EC. The Directive 2002/95/EC only applies to Directive 2002/96/EC categories 1-7 and 10, as stated in the "Article 2 - Scope" section of Directive 2002/95/EC.

#### DIRECTIVE 2002/96/EC (WEEE)

European customers who have purchased this equipment directly from Avtech will have completed a "WEEE Responsibility Agreement" form, accepting responsibility for WEEE compliance (as mandated in Directive 2002/96/EC of the European Union and local laws) on behalf of the customer, as provided for under Article 9 of Directive 2002/96/EC.

Customers who have purchased Avtech equipment through local representatives should consult with the representative to determine who has responsibility for WEEE compliance. Normally, such responsibilities with lie with the representative, unless other arrangements (under Article 9) have been made.

Requirements for WEEE compliance may include registration of products with local governments, reporting of recycling activities to local governments, and financing of recycling activities.

#### AC POWER SUPPLY REGULATORY NOTES

This instrument converts the AC input power to the +24V DC voltage that powers the internal circuitry of this instrument using a Tamura AAD130SD-60-A switching power supply. According to the manufacturer, the Tamura AAD130SD-60-A has the following certifications:

UL60950-1 IEC60950 -1 CSA C22.2 No. 60950- 1 EN60950 -1

and is compliant with:

EN61000-3-2 EN61000-4-2 Level 2 EN61000-4-2 Level 3 (Air Only) EN61000-4-4 Level 3 EN61000-4-5 Level 3 EN61000-4-11 CISPR 11 and 22 FCC Part 15 Class B (conducted)

#### **FIRMWARE LICENSING**

Instruments with firmware versions 5.00 or higher use open-source software internally. Some of this software requires that the source code be made available to the user as a condition of its licensing. This source code is distributed on the device itself. To access it, log in as user "source" with password "source". The source files are provided in this user's home directory, and are accessible using standard viewing and file transfer tools (such as vim, sz, and scp).

Earlier firmware versions do not contain any open source software.

#### INSTALLATION

#### VISUAL CHECK

After unpacking the instrument, examine to ensure that it has not been damaged in shipment. Visually inspect all connectors, knobs, liquid crystal displays (LCDs), and the handles. Confirm that a power cord, a GPIB cable, and two instrumentation manuals (this manual and the "Programming Manual for -B Instruments") are with the instrument. If the instrument has been damaged, file a claim immediately with the company that transported the instrument.

#### **POWER RATINGS**

This instrument is intended to operate from 100 - 240 V, 50 - 60 Hz.

The maximum power consumption is 90 Watts. Please see the "FUSES" section for information about the appropriate AC and DC fuses.

This instrument is an "Installation Category II" instrument, intended for operation from a normal single-phase supply.

#### CONNECTION TO THE POWER SUPPLY

An IEC-320 three-pronged recessed male socket is provided on the back panel for AC power connection to the instrument. One end of the detachable power cord that is supplied with the instrument plugs into this socket. The other end of the detachable power cord plugs into the local mains supply. Use only the cable supplied with the instrument. The mains supply must be earthed, and the cord used to connect the instrument to the mains supply must provide an earth connection. (The supplied cord does this.)

Warning: Failure to use a grounded outlet may result in injury or death due to electric shock. This product uses a power cord with a ground connection. It must be connected to a properly grounded outlet. The instrument chassis is connected to the ground wire in the power cord.

The table below describes the power cord that is normally supplied with this instrument, depending on the destination region:

Destination Region	Description	Option	Manufacturer	Part Number
United Kingdom, Hong Kong, Singapore, Malaysia	BS 1363, 230V, 50 Hz	-AC00	Qualtek	370001-E01
Australia, New Zealand	AS 3112:2000, 230-240V, 50 Hz	-AC01	Qualtek	374003-A01
Continental Europe, Korea, Indonesia, Russia	European CEE 7/7 "Schuko" 230V, 50 Hz	-AC02	Qualtek	364002-D01
North America, Taiwan	NEMA 5-15, 120V, 60 Hz	-AC03	Qualtek	312007-01
Switzerland	SEV 1011, 230V, 50 Hz	-AC06	Qualtek	378001-E01
South Africa, India	SABS 164-1, 220-250V, 50 Hz	-AC17	Volex	2131H 10 C3
Japan	JIS 8303, 100V, 50-60 Hz	-AC18	Qualtek	397002-01
Israel	SI 32, 220V, 50 Hz	-AC19	Qualtek	398001-01
China	GB 1002-1, 220V, 50 Hz	-AC22	Volex	2137H 10 C3

#### PROTECTION FROM ELECTRIC SHOCK

Operators of this instrument must be protected from electric shock at all times. The owner must ensure that operators are prevented access and/or are insulated from every connection point. In some cases, connections must be exposed to potential human contact. Operators must be trained to protect themselves from the risk of electric shock. This instrument is intended for use by qualified personnel who recognize shock hazards and are familiar with safety precautions required to avoid possibly injury. In particular, operators should:

- 1. Keep exposed high-voltage wiring to an absolute minimum.
- 2. Wherever possible, use shielded connectors and cabling.
- 3. Connect and disconnect loads and cables only when the instrument is turned off.
- 4. Keep in mind that all cables, connectors, oscilloscope probes, and loads must have an appropriate voltage rating.
- 5. Do not attempt any repairs on the instrument, beyond the fuse replacement procedures described in this manual. Contact Avtech technical support (see page 2 for contact information) if the instrument requires servicing. Service is to be performed solely by qualified service personnel.

#### **ENVIRONMENTAL CONDITIONS**

This instrument is intended for use under the following conditions:

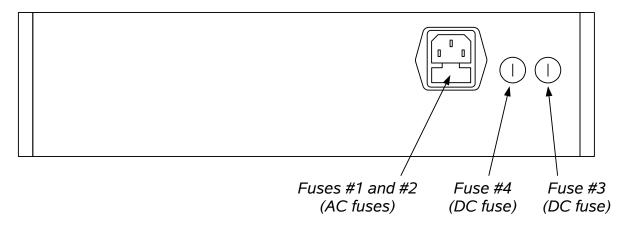

- 1. indoor use;
- 2. altitude up to 2 000 m;
- 3. temperature 5 °C to 40 °C;
- 4. maximum relative humidity 80 % for temperatures up to 31 °C decreasing linearly to 50 % relative humidity at 40 °C;
- 5. Mains supply voltage fluctuations up to ±10 % of the nominal voltage;
- 6. no pollution or only dry, non-conductive pollution.

#### **LABVIEW DRIVERS**

A LabVIEW driver for this instrument is available for download on the Avtech web site, at http://www.avtechpulse.com/labview. A copy is also available in National Instruments' Instrument Driver Library at http://www.natinst.com/.

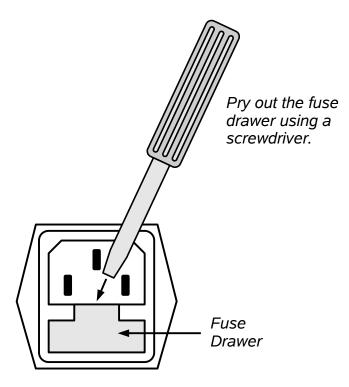

#### **FUSES**

This instrument contains four fuses. All are accessible from the rear-panel. Two protect the AC prime power input, and two protect the internal DC power supplies. The locations of the fuses on the rear panel are shown in the figure below:

#### AC FUSE REPLACEMENT

To physically access the AC fuses, the power cord must be detached from the rear panel of the instrument. The fuse drawer may then be extracted using a small flat-head screwdriver, as shown below:

## **DC FUSE REPLACEMENT**

The DC fuses may be replaced by inserting the tip of a flat-head screwdriver into the fuse holder slot, and rotating the slot counter-clockwise. The fuse and its carrier will then pop out.

#### **FUSE RATINGS**

The following table lists the required fuses:

	Nominal			Recommended F	Replacement Part
Fuses	Mains Voltage	Rating	Case Size	Littelfuse Part Number	Digi-Key Stock Number
#1 #2 (AC)	115 V	0.8A, 250V, Time-Delay	5×20 mm	0218.800HXP	F2418-ND
#1, #2 (AC)	230 V	0.5A, 250V, Time-Delay	5×20 mm	0218.500HXP	F2416-ND
#3 (DC)	N/A	3.15A, 250V, Time-Delay	5×20 mm	02183.15HXP	F2430-ND
#4 (DC)	N/A	1.6A, 250V, Time-Delay	5×20 mm	021801.6HXP	F2424-ND

The fuse manufacturer is Wickmann (http://www.wickmann.com/).

Replacement fuses may be easily obtained from Digi-Key (http://www.digikey.com/) and other distributors.

#### FRONT PANEL CONTROLS

1. <u>POWER Switch</u>. This is the main power switch. When turning the instrument on, there is normally a delay of 5-10 seconds before anything is shown on the main display.

If the main menu does not appear after 30 seconds, turn off the instrument and leave it off for at least 60 seconds before applying power again.

Allow 30 seconds before re-powering an instrument that has been switched off. If the power is switched more frequently than that, the turn-on delay may be longer (up to 20 seconds) as the internal software performs filesystem checks.

2. OVERLOAD Indicator. When the instrument is powered, this indicator is normally green, indicating normal operation. If this indicator is yellow, an internal automatic overload protection circuit has been tripped. If the unit is overloaded (by operating at an exceedingly high duty cycle or by operating into a very low impedance), the protective circuit will disable the output of the instrument and turn the indicator light yellow. The light will stay yellow (i.e. output disabled) for about 5 seconds after which the instrument will attempt to re-enable the output (i.e. light green) for about 1 second. If the overload condition persists, the output will be disabled again (i.e. light yellow) for another 5 seconds. If the overload condition has been removed, the instrument will resume normal operation.

This overload indicator may flash yellow briefly at start-up. This is not a cause for concern.

Note that the output stage will safely withstand a short-circuited load condition.

3. <u>OUT CONNECTOR</u>. This BNC connector provides the main output signal, into load impedances of  $50\Omega$ .

Caution: Voltages as high as ±400V may be present on the center conductor of this output connector. Avoid touching this conductor. Connect to this connector

using standard coaxial cable, to ensure that the center conductor is not exposed.

- 4. <u>SYNC OUT</u>. This connector supplies a SYNC output that can be used to trigger other equipment, particularly oscilloscopes. This signal leads (or lags) the main output by a duration set by the "DELAY" controls and has an approximate amplitude of +3 Volts to  $R_L > 50\Omega$  with a pulse width of approximately 100 ns.
- 5. <u>LIQUID CRYSTAL DISPLAY (LCD)</u>. This LCD is used in conjunction with the keypad to change the instrument settings. Normally, the main menu is displayed, which lists the key adjustable parameters and their current values. The "Programming Manual for -B Instruments" describes the menus and submenus in detail.

#### 6. KEYPAD.

Control Name	Function
MOVE	This moves the arrow pointer on the display.
CHANGE	This is used to enter the submenu, or to select the operating
	mode, pointed to by the arrow pointer.
×10	If one of the adjustable numeric parameters is displayed, this
	increases the setting by a factor of ten.
÷10	If one of the adjustable numeric parameters is displayed, this
	decreases the setting by a factor of ten.
+/-	If one of the adjustable numeric parameters is displayed, and
	this parameter can be both positive or negative, this changes the
	sign of the parameter.
EXTRA FINE	This changes the step size of the ADJUST knob. In the extra-
	fine mode, the step size is twenty times finer than in the normal
	mode. This button switches between the two step sizes.
ADJUST	This large knob adjusts the value of any displayed numeric
	adjustable values, such as frequency, pulse width, etc. The
	adjust step size is set by the "EXTRA FINE" button.
	When the main menu is displayed, this knob can be used to
	move the arrow pointer.

#### REAR PANEL CONTROLS

- 1. <u>AC POWER INPUT</u>. An IEC-320 C14 three-pronged recessed male socket is provided on the back panel for AC power connection to the instrument. One end of the detachable power cord that is supplied with the instrument plugs into this socket.
- 2. <u>AC FUSE DRAWER</u>. The two fuses that protect the AC input are located in this drawer. Please see the "FUSES" section of this manual for more information.
- 3. <u>DC FUSES</u>. These two fuses protect the internal DC power supplies. Please see the "FUSES" sections of this manual for more information.
- 4. <u>GATE</u>. This TTL-level (0 and +5V) logic input can be used to gate the triggering of the instrument. This input can be either active high or active low, depending on the front panel settings or programming commands. (The instrument triggers normally when this input is unconnected). When set to active high mode, this input is pulled-down to ground by a 1 k $\Omega$  resistor. When set to active low mode, this input is pulled-up to +5V by a 1 k $\Omega$  resistor.
- 5. TRIG. This TTL-level (0 and +5V) logic input can be used to trigger the instrument, if the instrument is set to triggering externally. The instrument triggers on the rising edge of this input. The input impedance of this input is  $1 \text{ k}\Omega$ . (Depending on the length of cable attached to this input, and the source driving it, it may be desirable to add a coaxial 50 Ohm terminator to this input to provide a proper transmission line termination. The Pasternack (www.pasternack.com) PE6008-50 BNC feed-thru 50 Ohm terminator is suggested for this purpose.)
- 6. <u>GPIB Connector</u>. A standard GPIB cable can be attached to this connector to allow the instrument to be computer-controlled. See the "Programming Manual for -B Instruments" for more details on GPIB control.

7. <u>RS-232 Connector.</u> A standard serial cable with a 25-pin male connector can be attached to this connector to allow the instrument to be computer-controlled. Instruments with firmware versions of 5.00 or higher require a user name ("admin") and a password ("default", as shipped from the factory) when logging into a serial terminal session. See the "Programming Manual for -B Instruments" for more details on RS-232 control.

#### **GENERAL INFORMATION**

#### BASIC PULSE CONTROL

This instrument can be triggered by its own internal clock or by an external TTL trigger signal. In either case, two mainframe output channels respond to the trigger: OUT and SYNC.

- OUT. This is the main output. A pulse doublet, consisting of pulses "1" and "2", is generated in response to each trigger event.
- SYNC. The SYNC pulse is a fixed-width TTL-level reference pulse used to trigger oscilloscopes or other measurement systems. When the delay is set to a positive value the SYNC pulse precedes the OUT pulse. When the delay is set to a negative value the SYNC pulse follows the OUT pulse.

These pulses are illustrated below, assuming internal triggering and a positive delay:

The next figure illustrates the relationship between the signal when an external TTL-level trigger is used:

In general, the delay, pulse width, and frequency (when in the internal mode), of the OUT pulse can be varied with front panel controls or via the GPIB or RS-232 computer interfaces.

#### POLARITY CONTROL

The polarity of both output pulses in the doublet is controlled by the polarity of AMPLITUDE 1 setting, which may be positive or negative. (The polarity of the AMPLITUDE 2 setting is ignored by the internal circuitry.)

#### TRIGGER MODES

This instrument has four trigger modes:

- Internal Trigger: the instrument controls the trigger frequency, and generates the clock internally.
- External Trigger: the instrument is triggered by an external TTL-level clock on the back-panel TRIG connector.
- Manual Trigger: the instrument is triggered by the front-panel "SINGLE PULSE" pushbutton.
- Hold Trigger: the instrument is set to not trigger at all.

These modes can be selected using the front panel trigger menu, or by using the appropriate programming commands. (See the "Programming Manual for -B Instruments" for more details.)

WARNING: The output stage may be damaged if triggered by an external signal at a pulse repetition frequency greater than 2 kHz.

#### **GATING MODES**

Triggering can be suppressed by a TTL-level signal on the rear-panel GATE connector. The instrument can be set to stop triggering when this input high or low, using the front-panel gate menu or the appropriate programming commands.

#### PROTECTING YOUR INSTRUMENT

#### TURN OFF INSTRUMENT WHEN NOT IN USE

The lifetime of the switching elements in the pulse generator module is proportional to the running time of the instrument. For this reason the prime power to the instrument should be turned off when the instrument is not in use. In the case of failure, the switching elements are easily replaced following the procedure described in a following section.

#### DO NOT EXCEED 2 kHz

The output stage may be damaged if triggered by an external signal at a pulse repetition frequency greater than 2 kHz.

#### USE A 50Ω LOAD

A 50 Ohm load is *required* for proper operation. The output stage may be damaged if the output is not terminated into a  $50\Omega$  load.

#### OPERATIONAL CHECK

This section describes a sequence to confirm the basic operation of the instrument. It should be performed after receiving the instrument. It is a useful learning exercise as well.

Before proceeding with this procedure, finish reading this instruction manual thoroughly. Then read the "Local Control" section of the "Programming Manual for -B Instruments" thoroughly. The "Local Control" section describes the front panel controls used in this operational check - in particular, the MOVE, CHANGE, and ADJUST controls.

A 50 Ohm load is *required* for proper operation. The output stage may be damaged if the output is not terminated into a  $50\Omega$  load.

The AVL-5-B-PN-TR-DP-KMPD output may be observed using either a high-speed sampling oscilloscope, or a slower real-time oscilloscope. To accurately observe these rising and falling edges, a sampling oscilloscope with a bandwidth of 2 GHz is required. However, if the rising and falling edges do not need to be accurately observed, it may be more convenient to use a real-time oscilloscope. The two basic test arrangements are outlined in the figures below:

BASIC TEST ARRANGEMENT, WITH A SAMPLING OSCILLOSCOPE

BASIC TEST ARRANGEMENT, WITH A REAL-TIME OSCILLOSCOPE

- 1. Connect the pulse generator to an oscilloscope using one of the two methods shown above. Note that:
  - a) If using a sampling oscilloscope, the use of 60 dB attenuator at the sampling scope vertical input channel will insure a peak input signal to the sampling scope of less than 1 Volt. WARNING: This model may provide a peak output power in excess of 800 W. The peak power rating of the attenuator must exceed this limit. Factory tests are conducted using a Midwest Microwave model ATT-0527-20-SMA-07 attenuator.
  - b) If using a realtime oscilloscope, a 50 Ohm load must be used to terminate the output.
  - c) The SYNC output channel provides TTL level signals (approximately 0 and +3V). To avoid overdriving the TRIG input channel of some sampling oscilloscopes, a 20 dB attenuator should be placed at the input to the scope trigger channel.
  - d) The bandwidth capability of components and instruments used to display the pulse generator output signal (attenuators, cables, connectors, etc.) should exceed 2 GHz.
  - e) Set the oscilloscope to trigger externally with the vertical setting at 100 mV/div for sampling oscilloscopes, or 100 V/div for real-time scopes, and the horizontal setting at 20 ns/div.
- 2. Turn on the AVL-5-B-PN-TR-DP-KMPD. The main menu will appear on the LCD.

- 3. To set the AVL-5-B-PN-TR-DP-KMPD to trigger from the internal clock at a PRF of 2 kHz:
  - a) The arrow pointer should be pointing at the frequency menu item. If it is not, press the MOVE button until it is.
  - b) Press the CHANGE button. The frequency submenu will appear. Rotate the ADJUST knob until the frequency is set at 2 kHz.
  - c) The arrow pointer should be pointing at the "Internal" choice. If it is not, press MOVE until it is.
  - d) Press CHANGE to return to the main menu.
- 4. To set the delay to 100 ns:
  - a) Press the MOVE button until the arrow pointer is pointing at the delay menu item.
  - b) Press the CHANGE button. The delay submenu will appear. Rotate the ADJUST knob until the delay is set at 100 ns.
  - c) The arrow pointer should be pointing at the "Normal" choice. If it is not, press MOVE until it is.
  - d) Press CHANGE to return to the main menu.
- 5. To set the pulse width to 50 ns:
  - a) Press the MOVE button until the arrow pointer is pointing at the pulse width menu item.
  - b) Press the CHANGE button. The pulse width submenu will appear. Rotate the ADJUST knob until the pulse width is set at 50 ns.
  - c) The arrow pointer should be pointing at the "Normal" choice. If it is not, press MOVE until it is.
  - d) Press CHANGE to return to the main menu.
- 6. At this point, nothing should appear on the oscilloscope.
- 7. To enable the output:
  - a) Press the MOVE button until the arrow pointer is pointing at the output menu item.

- b) Press the CHANGE button. The output submenu will appear.
- c) Press MOVE until the arrow pointer is pointing at the "ON" choice.
- d) Press CHANGE to return to the main menu.
- 8. To change the output amplitude:
  - a) Press the MOVE button until the arrow pointer is pointing at the amplitude menu item.
  - b) Press the CHANGE button. The amplitude submenu will appear. Rotate the ADJUST knob until the amplitude is set at +200V (or -200V for "-N" models).
  - c) Observe the oscilloscope. You should see 50 ns wide, 200V pulses. If you do not, you may need to adjust the delay setting to a value more compatible with your sampling oscilloscope. Repeat step 4 if required. You may also need to adjust the sampling scope controls.
  - d) Rotate the ADJUST knob. The amplitude as seen on the oscilloscope should vary. Return it to 200V.
  - e) ("-PN" units only) Press the +/- button on the front panel. The amplitude as seen on the oscilloscope should flip polarity, to -200V.
  - f) Press CHANGE to return to the main menu.
- 9. Try varying the pulse width, by repeating step (5). As you rotate the ADJUST knob, the pulse width on the oscilloscope will change. It should agree with the displayed value.

This completes the operational check.

#### PROGRAMMING YOUR PULSE GENERATOR

#### **KEY PROGRAMMING COMMANDS**

The "Programming Manual for -B Instruments" describes in detail how to connect the pulse generator to your computer, and the programming commands themselves. A large number of commands are available; however, normally you will only need a few of these. Here is a basic sample sequence of commands that might be sent to the instrument after power-up:

\*rst (resets the instrument) trigger:source internal (selects internal triggering) frequency 1000 Hz (sets the frequency to 1000 Hz) pulse:width1 5 ns (sets the pulse width of the leading pulse to 5 ns) (sets the pulse width of the trailing pulse to 10 ns) pulse:width2 10 ns pulse:delay1 50 ns (sets the delay of the leading pulse to 50 ns) pulse:delay2 500 ns (sets the delay of the trailing pulse to 500 ns) (sets the amplitude of the leading pulse to -50 V) volt:ampl1 -50 volt:ampl2 -100 (sets the amplitude of the leading pulse to -100 V) output on (turns on the output)

For triggering a single event, this sequence would be more appropriate:

\*rst (resets the instrument) trigger:source hold (turns off all triggering) pulse:width1 5 ns (sets the pulse width of the leading pulse to 5 ns) pulse:width2 10 ns (sets the pulse width of the trailing pulse to 10 ns) (sets the delay of the leading pulse to 50 ns) pulse:delay1 50 ns pulse:delay2 500 ns (sets the delay of the trailing pulse to 500 ns) output on (turns on the output) volt:ampl1 50 (sets the amplitude of the leading pulse to +50 V) (sets the amplitude of the leading pulse to +100 V) volt:ampl2 100 trigger:source immediate (generates a single non-repetitive trigger event) (turns off all triggering) trigger:source hold output off (turns off the output)

To set the instrument to trigger from an external TTL signal applied to the rear-panel TRIG connector, use:

\*rst (resets the instrument)
trigger:source external
pulse:width1 5 ns
pulse:width2 10 ns
pulse:delay1 50 ns
pulse:delay2 500 ns

(resets the instrument)
(selects internal triggering)
(sets the pulse width of the leading pulse to 5 ns)
(sets the pulse width of the trailing pulse to 10 ns)
(sets the delay of the leading pulse to 50 ns)
(sets the delay of the trailing pulse to 500 ns)

volt:ampl1 50	(sets the amplitude of the leading pulse to +50 V)
volt:ampl2 100	(sets the amplitude of the leading pulse to +100 V)
output on	(turns on the output)

These commands will satisfy 90% of your programming needs.

#### **ALL PROGRAMMING COMMANDS**

For more advanced programmers, a complete list of the available commands is given below. These commands are described in detail in the "Programming Manual for -B Instruments". (Note: this manual also includes some commands that are not implemented in this instrument. They can be ignored.)

#### MECHANICAL INFORMATION

#### TOP COVER REMOVAL

If necessary, the interior of the instrument may be accessed by removing the four Phillips screws on the top panel. With the four screws removed, the top cover may be slid back (and off).

Always disconnect the power cord and allow the instrument to sit unpowered for 10 minutes before opening the instrument. This will allow any internal stored charge to discharge.

There are no user-adjustable internal circuits. For repairs other than fuse replacement, please contact Avtech (info@avtechpulse.com) to arrange for the instrument to be returned to the factory for repair. Service is to be performed solely by qualified service personnel.

Caution: High voltages are present inside the instrument during normal operation. Do not operate the instrument with the cover removed.

#### **RACK MOUNTING**

A rack mounting kit is available. The -R5 rack mount kit may be installed after first removing the one Phillips screw on the side panel adjacent to the front handle.

#### **ELECTROMAGNETIC INTERFERENCE**

To prevent electromagnetic interference with other equipment, all used outputs should be connected to shielded loads using shielded coaxial cables. Unused outputs should be terminated with shielded coaxial terminators or with shielded coaxial dust caps, to prevent unintentional electromagnetic radiation. All cords and cables should be less than 3m in length.

#### MAINTENANCE

#### REGULAR MAINTENANCE

This instrument does not require any regular maintenance.

On occasion, one or more of the four rear-panel fuses may require replacement. All fuses can be accessed from the rear panel. See the "FUSES" section for details.

#### **CLEANING**

If desired, the interior of the instrument may be cleaned using compressed air to dislodge any accumulated dust. (See the "TOP COVER REMOVAL" section for instructions on accessing the interior.) No other cleaning is recommended.

#### TRIGGER DAMAGE

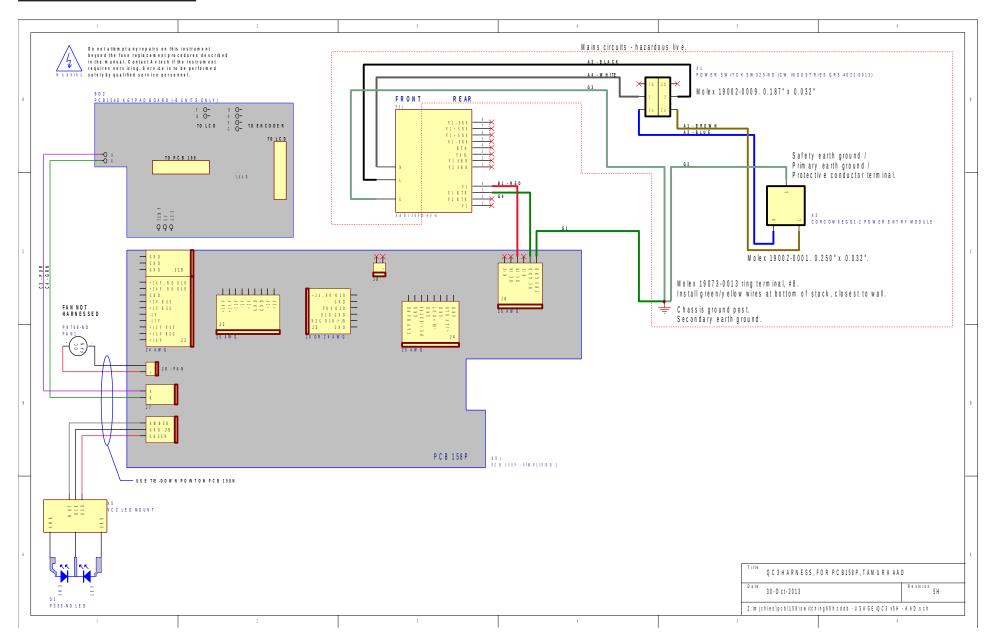

The rear-panel TRIG input, used in the external trigger mode, is protected by a diode clamping circuit. However, the protection circuit is not foolproof, and it is possible for a grossly excessive signal to damage the trigger circuitry on the main timing control board (the 4×10 inch board on the right side of the instrument).

The IC that is most likely to fail under these conditions is installed in a socket. It is a standard TTL IC in a 16-pin plastic DIP package, model 74F151 or equivalent.

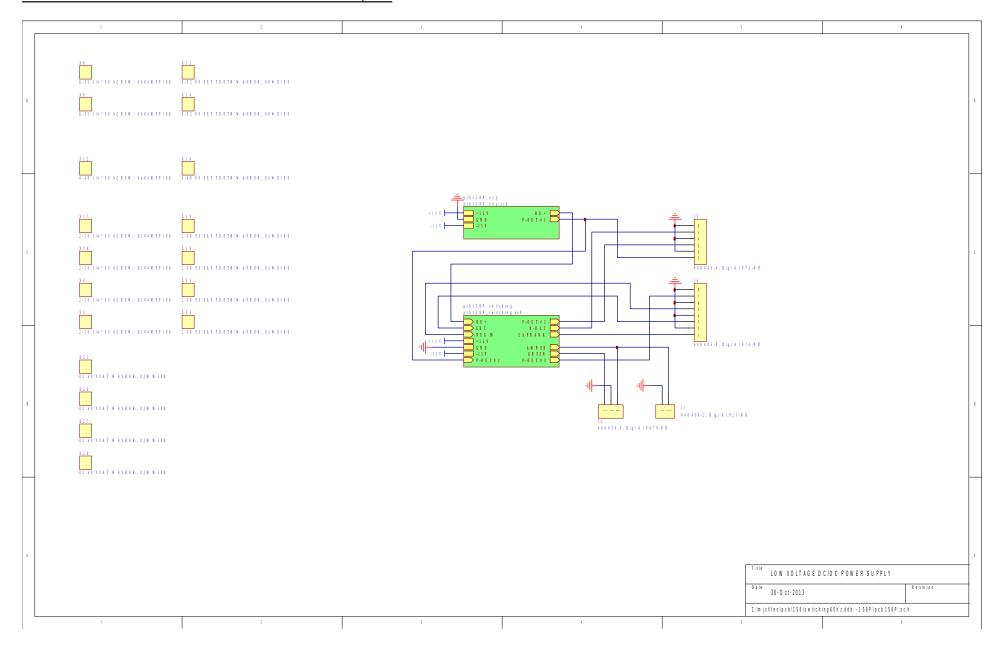

If you suspect that this IC has been damaged, turn off the power and replace this IC. It may be replaced by a 74F151, 74LS151, 74ALS151, or 74HCT151.
