INSTRUCTIONS

MODEL AVO-5C-PS PULSE GENERATOR

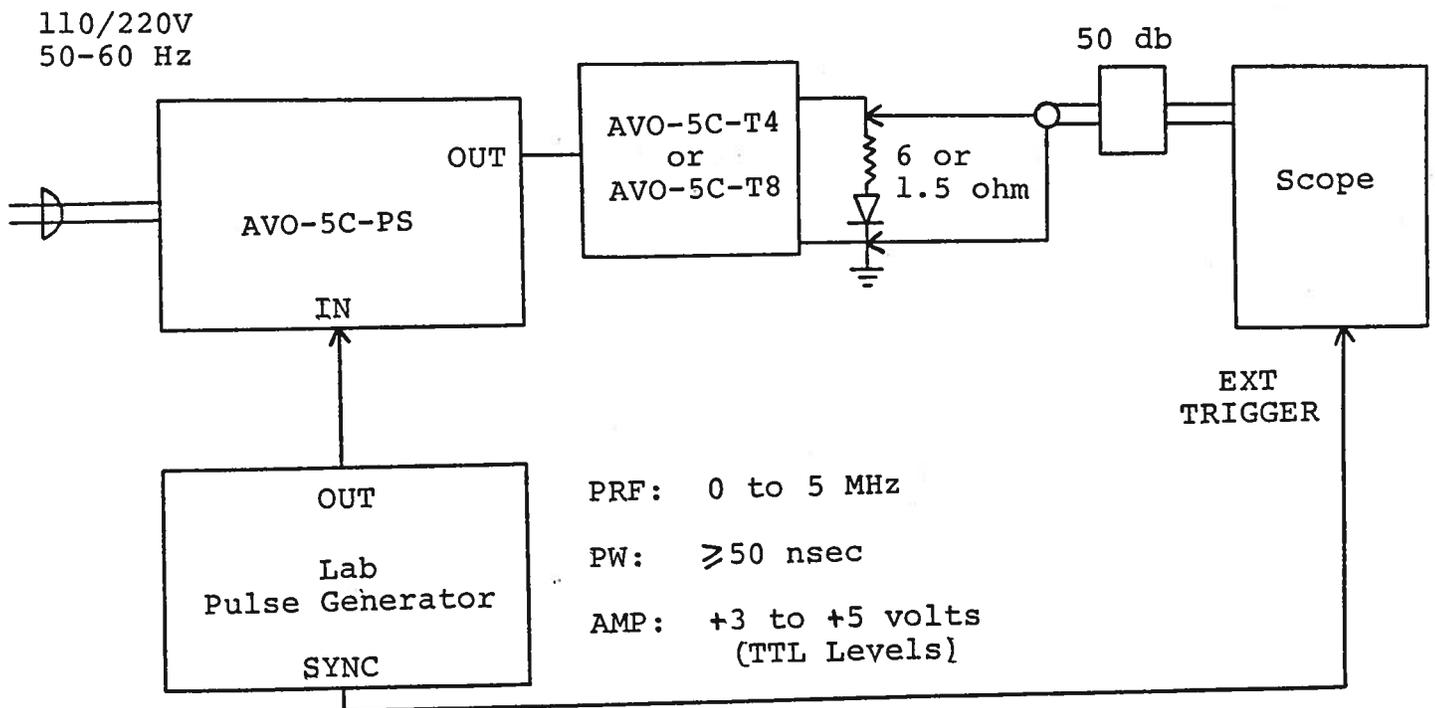

S.N. :

WARRANTY

Avtech Electrosystems Ltd. warrants products of its manufacture to be free from defects in material and workmanship under conditions of normal use. If, within one year after delivery to the original owner, and after prepaid return by the original owner, this Avtech product is found to be defective, Avtech shall at its option repair or replace said defective item. This warranty does not apply to units which have been disassembled, modified or subjected to conditions exceeding the applicable specifications or ratings. This warranty is the extent of the obligation or liability assumed by Avtech with respect to this product and no other warranty or guarantee is either expressed or implied.

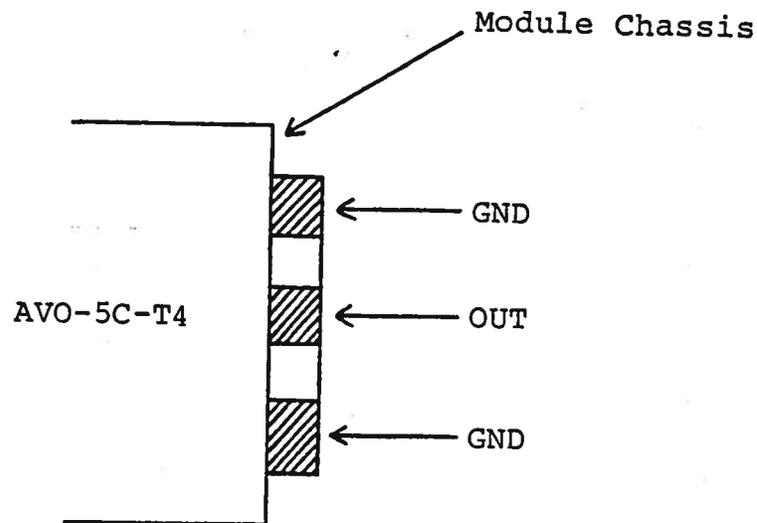

Fig. 1

PULSE GENERATOR TEST ARRANGEMENT

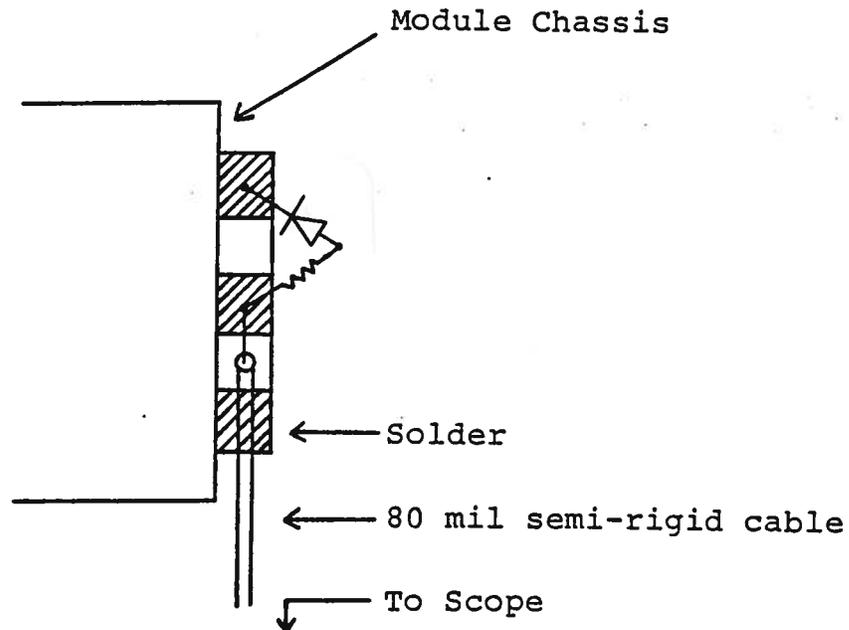

Notes:

- 1) The equipment should be connected in the general fashion shown above. Since the AVO unit provides an output pulse rise time as low as 5 nsec a fast oscilloscope (at least 50 MHz and preferably 200 MHz) should be used to display the waveform. If a sampling scope is used, a 50 db (or greater) attenuator should be used to insure a peak input to the scope of less than 0.5 volts.
- 2) The AVO-5C-T4 transformer module transforms the 50 volt output of the AVO-5C mainframe to 25 volts to 6.0 ohm to provide a peak diode as high as 4 amperes. (Use AVO-5C-T8 to obtain 8 amperes as discussed in paragraph 3). The AVO-5C-T4 module connects to the mainframe via two parallel 50 ohm miniature coaxial cables approx. 2 feet in length. The output terminals of the transformer module consists of a short length of microstrip transmission line protruding from the module chassis. The OUT terminal is the center conductor which is bounded on both sides by the ground plane (see below):

The diode load and series resistor (5.0 to 7.0 ohm 1/2 W carbon composition resistor) should be connected between the OUT and GND terminals using very short leads (\ll 0.2 cm). The voltage across the resistor-diode load may be monitored by connecting a length of 80 mil semi-rigid 50 ohm cable as shown below:

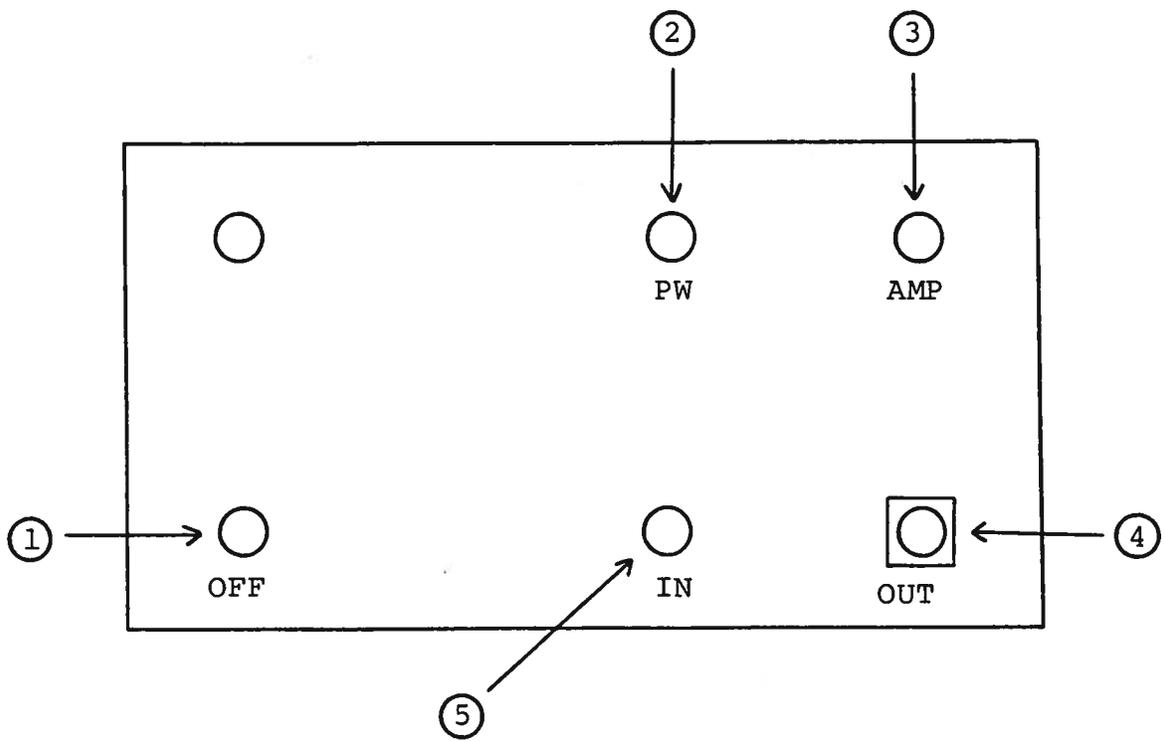

Take care to insure that during soldering the OUT conductor is not shorted to the chassis. Also, use minimal heat when soldering.

- 3) The AVO-5C-T8 module is used to obtain peak output currents as high as 8 amperes. This module transforms the 50 volt output of the AVO-5C mainframe to 12 volts to 1.5 ohms. The connections to the module are as per the AVO-5C-T4 module but the resistor should be about 1.5 ohm.
- 4) CAUTION: At maximum PRF and maximum pulse width, the AVO-5C unit provides an average output power as high as 20 watts. Considerable care must be taken to insure that the resistive load and the diode can dissipate this extremely high power. The power dissipated can be reduced by reducing the PRF and the pulse width. Note that the output duty cycle must not exceed 10% or the output switching elements may fail (see Repair Section).

Fig. 2

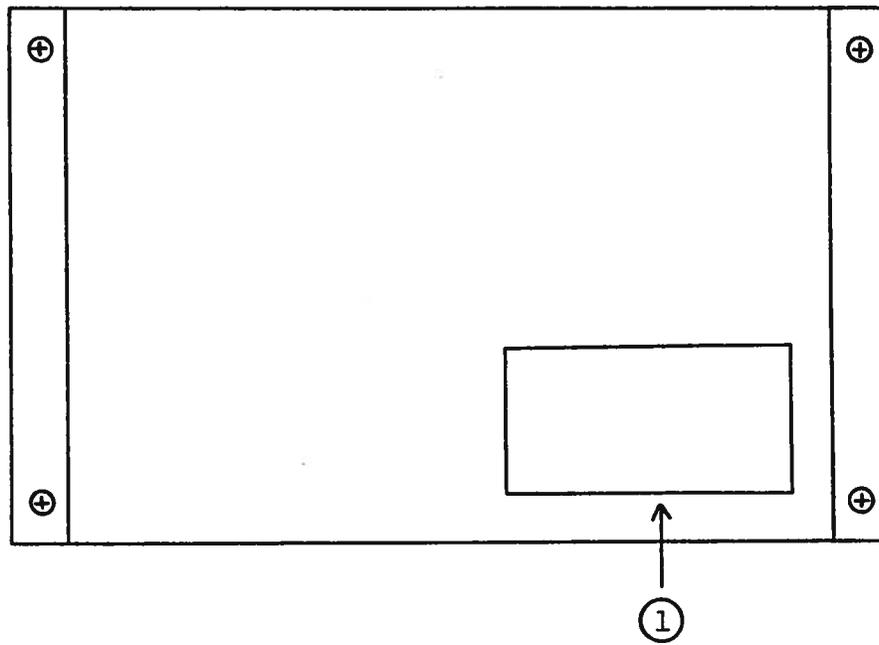

FRONT PANEL CONTROLS

- (1) ON-OFF Switch. Applies basic prime power to all stages.
- (2) PW Control. A one turn control which varies the output pulse width from 5 to 50 nsec.
- (3) AMP Control. The output pulse amplitude is controlled by means of the one turn potentiometer (AMP).
- (4) OUT Connectors. Two SMA connectors for two miniature coaxial cables connected to the AVO-5C-T module.
- (5) IN. The external trigger signal is applied at this input.

Fig. 3

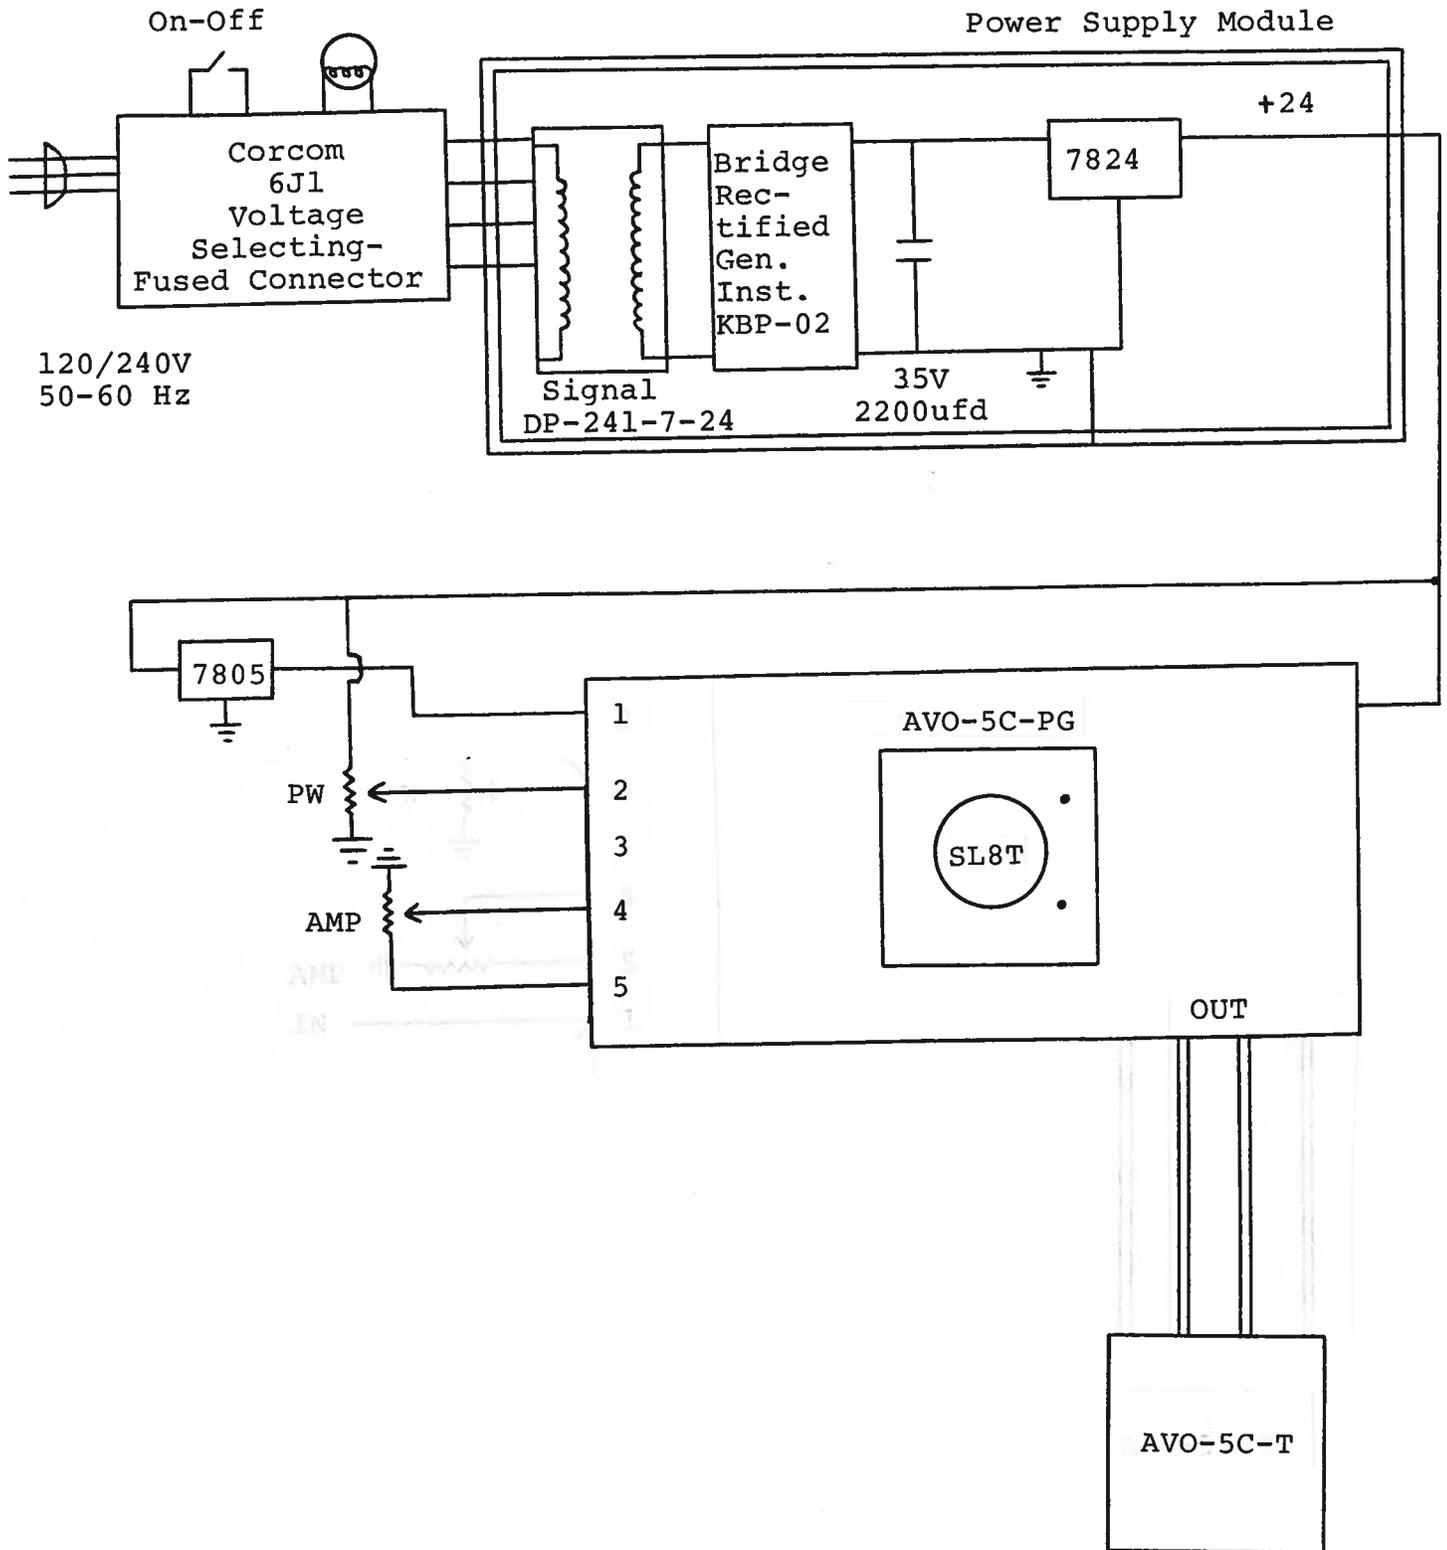

BACK PANEL CONTROLS

- (1) FUSED CONNECTOR, VOLTAGE SELECTOR. The detachable power cord is connected at this point. In addition, the removable cord is adjusted to select the desired input operating voltage. The unit also contains the main power fuse.

SYSTEM BLOCK DIAGRAM

SYSTEM DESCRIPTION AND REPAIR PROCEDURE

The AVO-5C-PS unit consists of the following basic modules:

- 1) AVO-5C-PG pulse generator module
- 2) +24V power supply board

The modules are interconnected as shown in Fig. 4 and Fig. 5.

In the event of an instrument malfunction, it is most likely that some of the output switching elements (SLBT) may have failed due to an output short circuit condition or to a high duty cycle condition. The switching elements may be accessed by removing the cover plate on the bottom side of the instrument. The cover plate is removed by removing the two 2-56 Phillips screws. NOTE: First turn off the prime power. CAUTION: Briefly ground the SLBT tabs to discharge the -70 volts power supply potential. The elements may be removed from their sockets by means of a needle nosed pliers after removing the two counter sunk 2-56 Phillips screws which attach the small aluminum heat sinks to the body of the AVO-5C-PG module. The SLBT is a selected VMOS power transistor in a TO 220 packages and may be checked on a curve tracer. If defective, replacement units should be ordered directly from Avtech. When replacing the SLBT switching elements, take care to insure that the short lead (of the three leads) is adjacent to the black dot on the chassis. The SLBT elements are electrically isolated from the small aluminum heat sinks but are bonded to the heat sinks using WAKEFIELD TYPE 155 HEAT SINK ADHESIVE. If the switching elements are not defective, then the four Phillips screws on the back panel should be removed. The top cover may then be slid off and the operation of the power supply modules checked. The power supply is functioning properly if it can provide up to 500 mA at +24V.

The sealed pulse generator module must be returned to Avtech for repair or replacement if the unit still will not operate.

SYSTEM DESCRIPTION FOR THE FOLLOWING PARTS

The AVD 20-25 unit consists of the following parts:

- 1. AVD-20-25 main control board
- 2. 110V power supply board

The following information is provided for the AVD 20-25:

In the event of an internal malfunction, it is most likely that some of the output switching elements (SMT) will have failed due to an output short circuit condition or to a high duty cycle condition. The switching elements may be replaced by removing the cover plate of the control board of the instrument. The cover plate is removed by turning the two Phillips screws. After the cover plate is removed, the 50 volt power supply potential, the elements may be removed and they can be replaced by means of a special screwdriver which removes the two control wires. 2-5/16" thick screws which attach the small aluminum heat sink to the end of the heat sink module. The SMT is a standard 1/2" heat sink transistor in a 10 1/2" package and may be checked on a curve tracer. In a defective replacement, this should be oriented correctly from the heat sink. When replacing the SMT switch element, take care to ensure that the short lead for the three leads is oriented to the back of the device. The SMT is electrically isolated from the heat sink aluminum plate and heat sink but are bonded to the heat sink using thermal paste. The switching elements are not detented. When the four Phillips screws on the back panel should be removed, the top cover may then be slid off and the operation of the power supply module checked. The power supply is a switching regulator which provides up to 500 mA at 12VDC.

The external power connector, which is used to power and to switch the heat sink element, is the only unit which is not specified.
